

## CCRN: How to generate enrolment graphs for your study

In 5 easy steps, here's how to download a graph showing enrolment data for a specific study:

1. Go to the CCRN website and select your language:

2. In the header, select Reports and choose *Researchers and research networks*.

### Vision

Conducting high quality clinical research on a large scale is essential for improving the health care available to Canadians.

### Mission

To strengthen the capacity for and improve the coordination of clinical research across Canada with the overarching objective of efficiently producing research evidence that will inform health care decisions in Canada.

3. Select the second option, *Show more on site recruitment by month.*

This information is crucial for researchers and research networks who are responsible for augmenting Canada's capacity for clinical research. Over time, visitors will also be able to see how different components of local research infrastructures are associated with research performance. In turn, this information may guide future investments in a national clinical research infrastructure.

It is also in this section that the scientific community may access granular information on the data and biological specimens being collected by each study team. Since data and biological specimens collected by a single study may be used multiple times to answer multiple research questions, this information will facilitate future analyses and maximize the output of the CCRN portfolio. It is also a way to build a better research infrastructure suited to the needs of all Canadian scientists. For example, if researchers conducting a clinical trial ask patients whether or not they consent to let other scientists use their data and biological specimens to answer future research questions, researchers who lead transitional research projects could rapidly benefit from a very large, pan-Canadian, federation of biobanks nested within clinical trials. This would be far more efficient than funding standalone biobanks because research teams are already being paid to collect data and biological specimens in the context of clinical trials. It would also avoid patients the added burden of participating in multiple projects.
